this volume the last of the series is devoted to water in its metastable forms especially at sub zero temperatures the past few years have witnessed an increasing interest in supercooled water and amorphous ice if the properties of liquid water in the normal temperature range are already eccentric then they become exceedingly so below the normal freezing point in the metastable temperature range water can be supercooled to 39 c without too much effort and most of its physical properties show a remarkable temperature dependence under these conditions although adequate explanations are still lacking the time has come to review available knowledge the study of amorphous ice that is the solid formed when water vapor is condensed on a very cold surface is of longer standing it has achieved renewed interest because it may serve as a model for the liquid state there is currently a debate whether or not a close structural relationship exists between amorphous ice and supercooled water the nucleation and growth of ice in supercooled water and aqueous solutions is also still one of those grey areas of research although these topics have received considerable attention from chemists and physicists over the past two decades even now the relationships between degree of supercooling nucleation kinetics crystal growth kinetics cooling rate and solute concentration are somewhat obscure nevertheless at the empirical level much progress has been made because these topics are of considerable importance to biologists technologists atmospheric physicists and glaciologists

this book consists of a number of papers regarding the thermodynamics and structure of multicomponent systems that we have published during the last decade even though they involve different topics and different systems they have something in common which can be considered as the signature of the present book first these papers are concerned with difficult or very nonideal systems i e systems with very strong interactions e g hyd gen bonding between components or systems with large differences in the partial molar v umes of the components e g the aqueous solutions of proteins or systems that are far from normal conditions e g critical or near critical mixtures second the conventional th modynamic methods are not sufficient for the accurate treatment of these mixtures last but not least these systems are of interest for the pharmaceutical biomedical and related ind tries in order to meet the thermodynamic challenges involved in these complex mixtures we employed a variety of traditional methods but also new methods such as the fluctuation t ory of kirkwood and buff and ab initio quantum mechanical techniques the kirkwood buff kb theory is a rigorous formalism which is free of any of the proximations usually used in the thermodynamic treatment of multicomponent systems this theory appears to be very fruitful when applied to the above mentioned difficult systems
